In this custom tailored learning plan you get a head start and learn 4 commonly used ways to integrate your Spring Boot backend with your single-page application and secure it.

In just a few hours, you will know how to implement 4 different types of integration and are ready to make better decisions when applying these principles in your context. You've been there and done that already while other developers are still wading through hundreds of pages of a fluffy compendium and still having no clue of how to solve the problem.

You learn best by coding. The way I love learning too.

What you will build:

We'll put a single-page application written in Angular 4 and Typescript as an Admin UI on top of the microservice built in my book "Spring Boot: How To Get Started and Build a Microservice". However, you don't need to know it. We will extend it with a single operation which teaches how to implement Pagination and integrate it with a single-page application securely in 4 different ways.

The focus is on the integration and security on the side of Spring Boot.

What you will learn:

- How to secure your API in Spring Boot 1.5.x
- How to use pagination for huge lists in your API
- How to protect your API with basic auth
- How to use Cross-Origin Resource Sharing (CORS) with Spring Boot
- How to implement JSON Web Tokens (JWT) in Spring Security
- How to use stateful authentication for your API and UI
- How to protect your application against Cross-Site-Request-Forgery (CSRF)
- How to make better decision when to use which integration type
